Graphical Abstract

We prepared a commercially viable Deep Eutectic Solvent (DES) based on Choline Chloride-Urea-copper acetate for the first time. It mediates the homocoupling of terminal alkynes, using air as an oxidant. Water is the only by-product of the entire process. The method avoids ligands, bases, oxidants, and costly palladium catalysts, which qualifies the process greener than ever. The DES can be reused at least three times without affecting the reaction yield significantly.

Abstract

We prepared a commercially viable Deep Eutectic Solvent (DES) based on Choline Chloride-Urea-copper acetate for the first time. It mediates the homocoupling of terminal alkynes, using air as an oxidant. Water is the only by-product of the entire process. The method avoids ligands, bases, oxidants, and costly palladium catalysts, which qualifies the process greener than ever. The DES can be reused at least three times without affecting the reaction yield significantly. The key features of the protocol that qualify the process as green include the ambient reaction temperatures, lesser use of conventional organic solvents in the reaction, higher yields, and easy product isolation qualify the protocol as a green process.
